

### **30 Second Script**

**Name: Vinokkumar Uthayakumar**

In E-money transfer, I am using relay module as my sensor. I'm using this sensor for security purposes. I am going to be connecting my relay module to raspberry pi3 and I also have a buzzer which is used to indicate the output of the relay module. The relay module will detect if the payment has done or not with the barcode created by my app from software. Once it detects that a stuff is been shoplifted then the buzzer will go off indicating that the transaction has not been made. By this way we can prevent scamming.
